## **STAC67**: Regression Analysis

Lecture 4

Sohee Kang

Jan. 21, 2021

### **Properties of Least Squares Estimates**

$$\hat{\beta}_{1} = \frac{\sum (X_{i} - \bar{X})(Y_{i} - \bar{Y})}{\sum (X_{i} - \bar{X})^{2}} = \frac{\sum (X_{i} - \bar{X})Y_{i}}{\sum (X_{i} - \bar{X})^{2}}$$

$$= \sum \langle X_{i} - \bar{X} \rangle^{2}$$

• The constants  $k_i$  have several interesting properties:

1 
$$\sum_{i=1}^{n} k_{i} = 0$$
  
2  $\sum_{i=1}^{n} k_{i}X_{i} = \frac{\sum(X_{i} - \bar{X})X_{i}}{S_{xx}} = \frac{\sum(X_{i} - \bar{X})X_{i}}{S_{xx}} = \frac{S_{xx}}{S_{xx}} = 1$ 

$$3 \sum_{i=1}^{n} k_i^2 = \underbrace{\sum (\times i - \times)^2}_{\text{Syx}} = \underbrace{\sum (\times i - \times)^2}_{\text{Syx}}$$

**Chapter 2: Inferences in Regression** 

## Sampling Distribution of Least Square Estimators

Everything you obtain from sample is all.

Expected value of LSE

• Expected value of LSE

• 
$$E(\hat{\beta}_1) = E(\sum k_i Y_i) = \sum k_i E(Y_i) = \sum k_i (B_0 + B_1 X_i)$$

•  $E(\hat{\beta}_1) = E(\sum k_i Y_i) = \sum k_i E(Y_i) = \sum k_i (B_0 + B_1 X_i)$ 

•  $E(\hat{\beta}_1) = E(\sum k_i Y_i) = \sum k_i E(Y_i) = \sum k_i E(X_i)$ 

•  $E(\hat{\beta}_1) = E(\sum k_i Y_i) = \sum k_i E(X_i) = E(X_i)$ 

$$E(\hat{\beta}_0) = E(\overline{Y} - B_1 \overline{X}) = E(\overline{Y}) - B_1 E(\overline{X}) = B_0 + B_1 \overline{X} - B_1 \overline{X} = B_0$$

$$\bullet E(\hat{\sigma}^2) = E\left(\frac{\sum e_i^2}{\sqrt{2}}\right) = 6^2$$

## Sampling Distribution of Least Square Estimators

Variance of least squre estimators

2 
$$Var(\hat{\beta}_0) = Var(\bar{\gamma} - \hat{\beta}_1 \bar{\chi}) = Var(\bar{\gamma}) + \bar{\chi}^2 Var(\hat{\beta}_1)$$

$$= \frac{6^2}{6^2} + \bar{\chi}^2 + \frac{6^2}{5 \times x}$$

$$= 6^2 \left(\frac{1}{x} + \frac{\bar{\chi}^2}{5 \times x}\right)$$

$$= \frac{6^2}{6^2} \times \frac{55E}{6^2} \text{ when not known.}$$

Sohee Kang

## Sampling Distribution of Least Square Estimators

• Theorem 2

$$E(\hat{eta}_0) = eta_0, \quad E(\hat{eta}_1) = eta_1$$

$$Var(\hat{eta}_0) = \left(\frac{1}{n} + \frac{\bar{X}^2}{S_{xx}}\right)\sigma^2, \quad Var(\hat{eta}_1) = \frac{\sigma^2}{S_{xx}}$$

• The variances in theorem 2, depends on the unknown value of  $\sigma^2$ . If we replace  $\sigma^2$  with unbiased estimator,  $\hat{\sigma}^2$  and take the squre root, we get the standard error of the estimators:

Standard error

SE(B<sub>1</sub>) = 
$$\sqrt{\frac{6^2}{5xx}}$$

SE(B<sub>1</sub>) =  $\sqrt{\frac{6^2}{5xx}}$ 

SE(B<sub>1</sub>) =  $\sqrt{\frac{6^2}{5xx}}$

## Inference about Regression Parameters

Simple Linear Model with Normal Errors

$$Y_i = \beta_0 + \beta_1 X_i + \epsilon_i,$$

#### where

- $\beta_0$  and  $\beta_1$  are parameters
- $\epsilon_i$  are i.i.d with normal distribution with mean 0 and variance,  $\sigma^2$ .

$$\epsilon_i \sim N(0, \sigma^2)$$

Under this model,

$$Y_i|X_i \sim N(\beta_0 + \beta_1 X_i, \sigma^2)$$

## Inference about Regression Parameters

• Inference about  $\beta_1$   $\beta_1 \sim N \left(\beta_1 / \frac{\delta^2}{S_{XX}}\right) \sim \frac{\beta_1 - \beta_1}{\beta_1}$  $\sim N(0, +)$ 

 $\bullet$   $\sigma$  is unknown, and must be estimated.

$$T = \frac{\hat{\beta}_1 - \beta_1}{\left(\frac{\hat{\sigma}}{\sqrt{S_{xx}}}\right)} \sim t(n-2)$$

 Review: the Student's t-distribution with k degrees of freedom can be defined as the random variable T

$$T = \frac{Z}{\sqrt{V/k}} \sim t_{(k)},$$
 where, 
$$0 < \sqrt{\sqrt{V/k}} \sim t_{(k)},$$
 
$$0 < \sqrt{\sqrt{V/k}} \sim t_{(k)},$$
 where, 
$$0 < \sqrt{\sqrt{V/k}} \sim t_{(k)},$$
 Sohee Kang STAC67: Regression Analysis

# Sampling ditribution of $\beta_1$

How to prove

$$\frac{\beta_{1} - \beta_{1}}{S_{\hat{\beta}_{1}}} \sim t(n-2)?$$
1.  $\frac{\hat{\beta}_{1} - \beta_{1}}{S_{\hat{\beta}_{1}}} = \frac{\hat{\beta}_{1} - \beta_{1}}{V_{M}(\hat{\beta}_{1})} = \frac{\hat{\beta}_{1} - \beta_{1}}{V_{M}(\hat{\beta}_{1})}$ 

$$\frac{S_{\hat{\beta}_{1}}}{V_{M}(\hat{\beta}_{1})} = \frac{\hat{\beta}_{1} - \beta_{1}}{V_{M}(\hat{\beta}_{1})} = \frac{\hat{\beta}_{1} - \beta_{$$

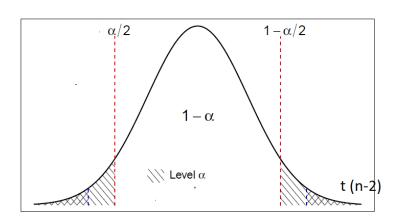

## Inference about Regression Parameters

Theorem 3: Sampling distributions

$$\frac{\hat{eta}_0 - eta_0}{SE(\hat{eta}_0)} \sim t(n-2), \quad \frac{\hat{eta}_1 - eta_1}{SE(\hat{eta}_1)} \sim t(n-2)$$

• Confidence Interval for  $\beta_0$  and  $\beta_1$ 

Since 
$$\frac{\hat{\beta}_j - \beta_j}{SE(\hat{\beta}_j)} \sim t(n-2), \ j = 0, 1$$
  $\left( (-\kappa) \le \sqrt{\frac{\hat{\beta}_j - \beta_j}{\kappa/2}} \le \frac{\hat{\beta}_j - \beta_j}{SE(\hat{\beta}_j)} \right)$ 

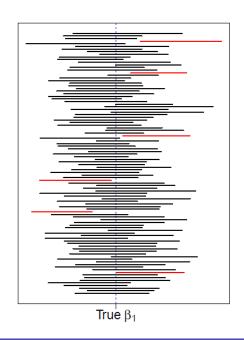

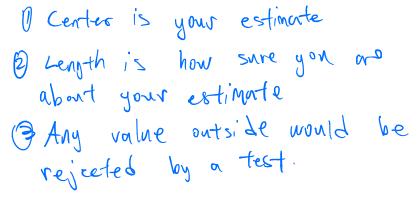

#### **Confidence Intervals**

For [10] ([- 
$$lpha$$
) 1/0 LI  $\hat{eta}_j \pm t(1-lpha/2;n-2)SE(\hat{eta}_j), j=0,1$ 

Why should we care about confidence intervals?

 The confidence interval completely captures the information in the data about the parameter.

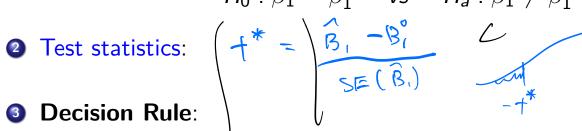

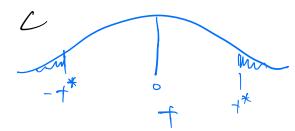

# Hypothesis test concerning $\beta_1$

Two-sided test:

$$H_0: \beta_1 = \beta_1^0$$
 vs  $H_a: \beta_1 \neq \beta_1^0$ 

P-value approach: we can compute the

 $\begin{array}{c} \text{reject tho} \\ p-\text{value} = 2 \times P(t_{(n-2)} \geq |t^*|) \\ \text{The probability of observing value were extreme} \\ \text{than } t^* \end{array}$ 

where  $\alpha$  is the level of significance, or probability of type I error,  $\alpha =$  $Pr(Reject H_0 \mid H_0 \text{ is true}).$ 

Critical value approach:

If 
$$|t^*| > t(1-\alpha/2; n-2)$$
, Reject Ho  
If  $|t^*| \le t(1-\alpha/2; n-2)$ , Accept Ho

# **Exercise (Crime Rate)**

	Estimate	Std. Error	t value	Pr(> t )
(Intercept)	20517.5999	3277.64269	6.259865	0.00e+00
X	-170.5752	41.57433	-4.102897	9.57e-05

• Test whether or not there is a linear association between crime rate and percentage of high school graduates, using a t test with  $\alpha = 0.01$ . State the hypotheses, decision rule, and conclusion.

# **Exercise (Crime Rate)**

© Critical Val Approach.  

$$|++|=4.103 = +(1-0.01) = 2.6371$$
  
rode:  $9+(0.995.182)$   
... we seject Ho.

• Estimate  $\beta_1$  with a 99 % confidence interval. Interpret the interval estimate.  $\land$ 

## **2.4 Interval Estimation of** $E(Y|X=x_0)$

Suppose that  $x_0$  is a new value of x for which we want to do prediction.

- Estimation of  $\mu_0 = E[Y|X = x_0]$
- 2 Prediction of Y value for an individual with  $X = x_0$ 
  - We use fitted regression model to do both of these
  - Estimation of  $\mu_0$

$$\mu_0 = \beta_0 + \beta_1 X_0$$

Let's derive the variance formula:

# **Derivation of** $Var(\hat{Y}_0)$

## Confidence Interval for $\mu_0 = E(Y|X = x_0)$

• A  $(1-\alpha)$ % confidence interval for  $\mu_0$ :

$$\hat{Y}_0 \pm t(1-\alpha/2; n-2)SE(\hat{Y}_0)$$

 Exercise: Obtain 95% confidence interval for the mean crime rate for states of high school graduate rate of 80%.

```
new.data = data.frame(X=80)
predict(fit, new.data, interval="confidence")
```

```
## fit lwr upr
## 1 6871.585 6347.116 7396.054
```

#### 2.5 Prediction of new observation

The value of Y for an individual with  $X = x_0$  is:

$$Y_0 = \beta_0 + \beta_1 X + \epsilon_0$$

- Estimate of  $Y_0$ :  $\hat{Y}_0 = \hat{\beta}_0 + \hat{\beta}_1 X_0 = \hat{\mu}_0$
- Prediction error:  $e_0 = Y_0 \hat{Y}_0$
- $Var(e_0) = Var(Y_0 \hat{Y}_0)$

•  $100 \times (1 - \alpha)\%$  Prediction Interval for a new observation  $Y_{0(new)}$  with  $X = x_0$  is:

$$\hat{Y}_0 \pm t(1-\alpha/2; n-2)s_{\{pred\}}$$

#### **Exercise**

• Exercise: Obtain 95% prediction interval for the crime rate for states of high school graduate rate of 80%.

```
new.data = data.frame(X=80)
predict(fit, new.data, interval="prediction")
```

```
## fit lwr upr
## 1 6871.585 2154.92 11588.25
```

# **Graph Prediction Intervals (using ggplot)**

```
Crime.Pred <- predict(fit, interval="prediction")</pre>
```

```
## Warning in predict.lm(fit, interval = "prediction"): predictions on current data refer to _future_ responses
```

```
new.df = cbind(Crime,Crime.Pred)
library(ggplot2)
ggplot(data=new.df, aes(X, Y)) +
geom_point()+
geom_line(aes(y=lwr), color="red", linetype="dashed")+
geom_line(aes(y=upr), color="red", linetype="dashed")+
geom_smooth(method=lm, se=TRUE) + theme(plot.margin=unit(c(-1, 8, 7, 4), "cm"))
```
